Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	4 Marks

Empathy Map Canvas

This empathy map captures the needs, concerns, behaviours and expectations of ServiceNow users and administrators who import spreadsheet data, map fields through Transform Maps, access related employee information, and protect records with role-based security.

Target User: ServiceNow user / administrator who needs to import employee training data from a spreadsheet accurately and ensure that imported records remain secure.

THINK & FEEL • Wants spreadsheet data to import correctly • Concerned about incorrect or missing field mappings • Needs clear and predictable import results • Expects imported records to remain secure	SEE • Spreadsheet with Training Name, Completion Date, Status and Employee • Import Set and Transform Map configuration • Mapped source and target fields • Imported records and access results
HEAR • "The spreadsheet should map to the correct fields." • Team members discuss import and mapping issues • Admins explain Transform Map and role permissions • Users report missing or incorrect imported data	SAY & DO • Creates the spreadsheet with required fields • Uploads the file through System Import Sets • Creates and runs a Transform Map • Tests imported records using appropriate users
PAIN • Incorrect field mapping can create wrong records • Missing employee references or field values • Import errors are difficult to troubleshoot • Unauthorized users may access imported records	GAIN • Accurate spreadsheet-to-table import • Correct Transform Map field mapping • Employee details available through dot-walking • Role-based access and easier security testing

Key Insight: Accurate importing and controlled access are both important. The Transform Map should correctly match spreadsheet fields to the ServiceNow table, while roles and ACLs should control who can view or edit the imported records.

Empathy Map - Import Data using Transform Maps

Spreadsheet Import, Mapping and Data Security

THINK & FEEL	SEE	HEAR
I want the spreadsheet to import correctly. I worry about incorrect mappings. I need predictable import results.	Spreadsheet source fields. Transform Map field mappings. Imported records and access results.	Import instructions from administrators. Team discussions about mapping issues. Reports about permission problems.
SAY & DO	PAIN	GAIN
Creates and uploads the spreadsheet. Maps source fields to target fields. Runs the transform and tests records.	Wrong or missing field values. Employee reference not mapped correctly. Imported records exposed to the wrong users.	Accurate data import. Useful related employee information. Role-based access and secure records.

User Need Identified

The user needs a simple and reliable mechanism to import spreadsheet data into ServiceNow. The spreadsheet should contain the required fields, the Transform Map should connect each source field to the correct target field, and the Employee reference should allow related information such as department to be accessed through dot-walking. Access controls should then protect the imported records.

Expected User Experience

- Spreadsheet with required fields → file uploaded through System Import Sets.
- Source fields → correctly mapped to target table fields using a Transform Map.
- Transform run → records imported into the Employee Training Records table.
- Employee reference → related department information can be accessed through dot-walking.
- Authorized user → can view or edit records according to assigned role and ACL.
- Unauthorized user → cannot access protected records.

Reference

Content adapted from the provided “Importing & Securing Data in ServiceNow” document, including the spreadsheet import, Transform Map, dot-walking, roles, ACL and testing workflow. The page structure and section naming follow the provided Empathy Map template.
