

Ideation Phase

Restrict Record Access Based on Field Value

Date	30 September 2026	Team ID	SWTID-2026-1617
Project Name	Import Data using Transform Maps (Spreadsheet)	Maximum Marks	4 Marks

Project Focus

The project focuses on importing spreadsheet data into ServiceNow using System Import Sets and Transform Maps. The solution creates an Employee Training Records table, maps the spreadsheet fields to the correct target fields, uses the Employee reference to access related information such as Department through dot-walking, and applies roles and ACLs to secure the imported records.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Problem Statement

In a ServiceNow environment, employee training information may be maintained in spreadsheets. Manually entering these records can be time-consuming and may cause inconsistent data. A reliable import process is required to load the spreadsheet, map its fields correctly, transform the data into the target table, and protect the imported records using appropriate access controls.

Requirement Identified

- Create an Employee Training Records table with the required fields.
- Prepare a spreadsheet with Training Name, Completion Date, Status and Employee.
- Upload the spreadsheet through System Import Sets.
- Create a Transform Map and map each source field to the correct target field.
- Run the transform to create the Employee Training Records.
- Use the Employee reference to access Department information through dot-walking.
- Configure users, roles and ACLs to control access to imported records.
- Test both the import result and record security.

Step-2: Brainstorm, Idea Listing and Grouping

Category	Brainstormed Idea
Table Setup	Create the Employee Training Records table with Training Name, Completion Date, Status and Employee fields.
Spreadsheet	Create the spreadsheet with the four required source fields and employee data.
Import Set	Use System Import Sets to upload the spreadsheet and create the import source.
Transform Map	Create a Transform Map and connect each spreadsheet source field with the matching target field.
Transform	Run the transform to import the spreadsheet records into the target table.
Dot-Walking	Use the Employee reference to access related Department information.
Security	Use users, roles and ACLs to control who can view or edit the imported records.
Testing	Verify imported values and test authorized and unauthorized record access.

Grouping of Ideas

Data Preparation: Table + Spreadsheet **Import:** Import Set + Transform Map + Field Maps **Related Data:** Employee Reference + Dot-Walking **Security:** Roles + ACLs **Verification:** Import + Access Tests

Step-3: Idea Prioritization

The ideas are prioritized according to their role in completing the Import Data using Transform Maps (Spreadsheet) workflow.

Priority	Activity	Reason
1	Create Employee Training Records Table	Provides the target table and required fields for the imported training data.
2	Prepare Spreadsheet	Provides Training Name, Completion Date, Status and Employee as the source data.
3	Import Spreadsheet	Loads the source file into ServiceNow through System Import Sets.
4	Create Transform Map and Field Maps	Connects each source field with its correct target field.
5	Run Transform	Creates records in the Employee Training Records table from the imported data.
6	Dot-Walking	Allows related Employee information such as Department to be accessed.
7	Configure Roles and ACLs	Provides controlled access to the imported records.
8	Test Import and Security	Confirms correct field values and verifies authorized and unauthorized access.

Expected Outcome

- Spreadsheet data is successfully loaded through System Import Sets.
- Transform Maps correctly map and transform the source fields into the target table.
- Employee reference data supports dot-walking to related Department information.
- Roles and ACLs control access to the imported records.
- Import and security tests demonstrate the completed workflow.

Final Selected Idea

Import Data using Transform Maps (Spreadsheet)

Implement a spreadsheet-based import into ServiceNow using Import Sets and Transform Maps, then use Employee references, dot-walking, roles and ACLs to support related information and secure access to the imported records.

Title Note

The document title is intentionally kept as **Restrict Record Access Based on Field Value** as requested, while the project content has been changed to the Importing & Securing Data in ServiceNow workflow from the supplied project material.
