

Project Design Phase

Problem - Solution

Date	30 September 2026
Team ID	SWTID-2026-1617
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	2 Marks

Problem - Solution: The project addresses the need to bring employee training data from a spreadsheet into ServiceNow, map it accurately to Employee Training Records, use related employee information for reporting, and protect the imported records through roles and Access Control Lists (ACLs).

Proposed Solution:

S.No.	Parameter	Description
1.	1. Problem Statement (Problem to be solved)	Employee training information may be maintained in spreadsheets while operational records are managed in ServiceNow. A structured method is needed to import Training Name, Completion Date, Status and Employee data, connect records to employees, and control access to the resulting records.
2.	2. Idea / Solution description	Create the Employee Training Records table with Training Name, Completion Date, Status and Employee fields. Upload the spreadsheet through System Import Sets, create a Transform Map, add Field Maps and run Transform. Use Employee reference dot-walking to access Department information, then configure users, roles and ACLs.
3.	3. Novelty / Uniqueness	The solution combines spreadsheet-based data importing, Transform Maps, reference-field dot-walking and role-based ACL security in one ServiceNow workflow. This connects data integration, related information and access control within the same implementation.
4.	4. Social Impact / Customer Satisfaction	The solution reduces manual data entry and helps maintain consistent training records. Dot-walking supports easier access to related employee information, while role and ACL configuration helps protect records from unauthorized access.
5.	5. Business Model (Revenue Model)	The provided project documentation does not define a direct revenue model. The solution is positioned as an internal ServiceNow capability for managing employee training information, reporting and controlled access.
6.	6. Scalability of the Solution	The approach can be extended with additional spreadsheet records, fields, training information, users and roles. Transform Maps and Field Maps can be updated as data requirements change, while ACLs can be expanded to support additional access requirements.

Solution Summary: The solution fits the project requirement by combining accurate spreadsheet import with Transform Maps, related-data access through dot-walking, and role/ACL-based security. The source documentation concludes that these functions support accurate data integration, streamlined data relationships and protection of sensitive information.

Source basis: Importing & Securing Data in ServiceNow — table creation and fields (pp. 1–2), spreadsheet import and Transform Maps (pp. 3–5), dot-walking (p. 6), roles and user creation (pp. 7–9), ACL configuration and testing (pp. 10–13), and conclusion (p. 14).
